

Plastics and other pollutants kill some living thing !

Now a few numbers :

The coast lines are thus the first affected since more than 120 million bags pollute the 5 000Km of French coast. In water, a real « plastic sea » is formed : 75% of the waste found at sea is plastic.

If you buy a plastic bag, throw it in an appropriate trash can, don't throw it in nature, think about the following, think of the consequences, put yourself in the place of the animals that die from it !!!

so don't leave your trash on the floor !!!

Distributed en masse in your supermarket or store, plastic bags have a disastrous effect on the environment and cause the disappearance of many species.

100 000 marine animals die each year from ingesting plastic. Indeed, turtles are the most affected because they confuse the shape of the bags with that of the jellyfish. Similarly, more than a million birds die confusing them with floating fish eggs on the surface of the water.
