

# RECYCLING FOR SAVING

*There is a lot of recyclable materials, like plastic or cardboard. But they don't have the same properties. Buying recyclable materials, and doing selective waste sorting is the best way to save the Earth at our scale.*

In France, 65% of cardboard is recycled. This material can be used until it's dissolve. In nature, it survive between 5 month and 1 year before disappearing. It's a biodegradable material.

Plastic can also be recycled, but not totally. It's an overproduce material, omnipresent in our society. So when it is in nature it became dangerous. Plastic takes 100/200 years to degrade, before polluting our environnement. This will impact every living organism on Eath.
